

Manage Kubernetes Resources via Terraform - macOS

- `install/open docker`
- `install kubectl/minikube`

```
brew install kind
```

- `touch kind-config.yaml` and put the following config file in it

```
kind: Cluster
apiVersion: kind.x-k8s.io/v1alpha4
nodes:
- role: control-plane
  extraPortMappings:
  - containerPort: 30201
    hostPort: 30201
    listenAddress: "0.0.0.0"
```

- `curl https://raw.githubusercontent.com/hashicorp/learn-terraform-deploy-nginx-kubernetes-provider/master/kind-config.yaml --output kind-config.yaml`

```
GMN21:terraform grand$ kind create cluster --name terraform-learn --config kind-config.yaml
Creating cluster "terraform-learn" ...
✓ Ensuring node image (kindest/node:v1.20.2)
✓ Preparing nodes
✓ Writing configuration
✓ Starting control-plane
✓ Installing CNI
✓ Installing StorageClass
Set kubectl context to "kind-terraform-learn"
You can now use your cluster with:

kubectl cluster-info --context kind-terraform-learn

Thanks for using kind! 😊
```

- `kind get clusters`

```
GMN21:terraform grand$ kind get clusters
terraform-learn
```

- `mkdir learn-terraform-deploy-nginx-kubernetes`
- `cd learn-terraform-deploy-nginx-kubernetes`

`touch kubernetes.tf` add the following config file

```
terraform {
  required_providers {
    kubernetes = {
      source = "hashicorp/kubernetes"
    }
  }
}

provider "kubernetes" {
  config_path = "~/.kube/config"
}
```

- `touch terraform.tfvars/ vim terraform.tfvars`
- `terraform init`
- Add the following to a file `kubernetes.tf`

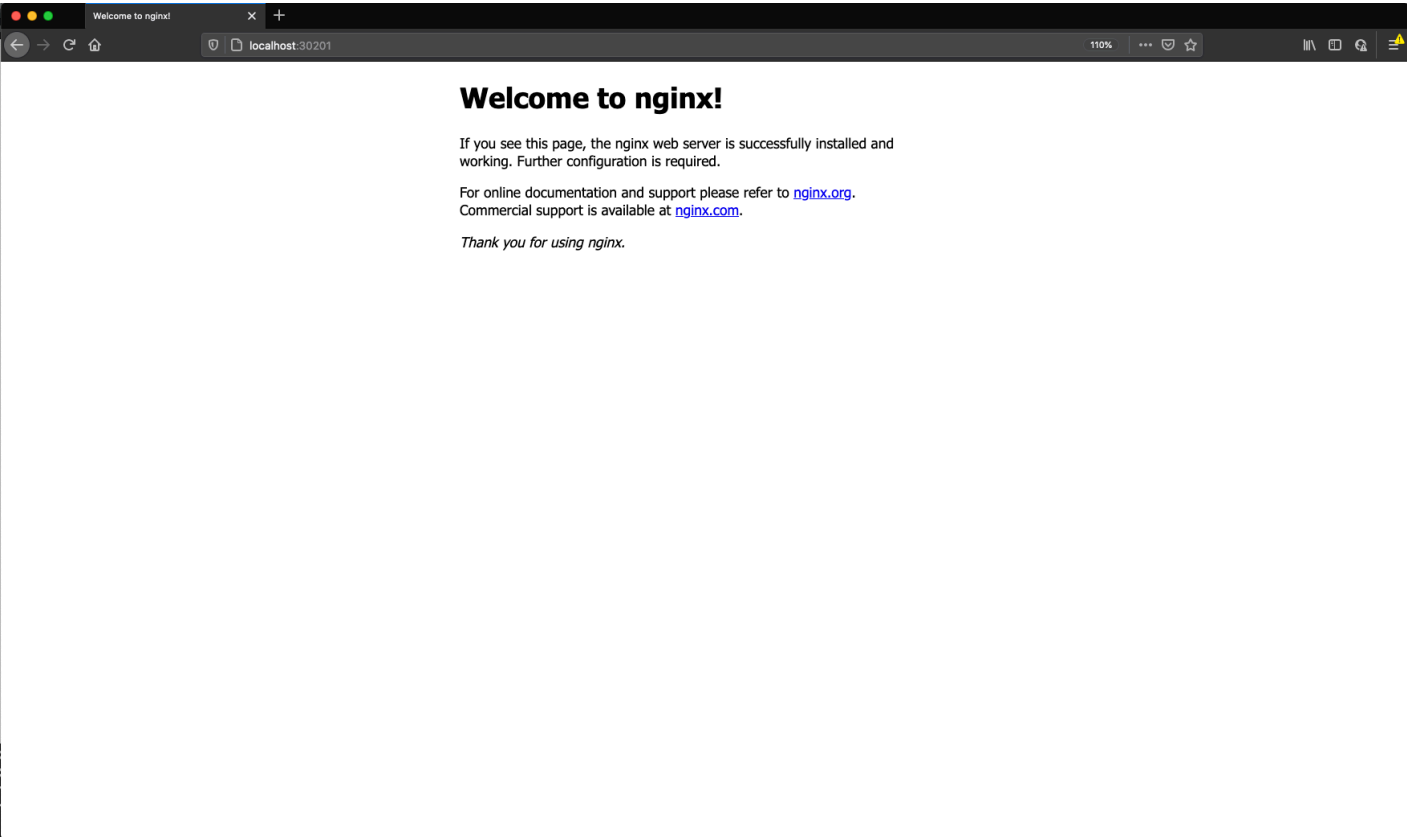

```

resource "kubernetes_deployment" "nginx" {
  metadata {
    name = "scalable-nginx-example"
    labels = {
      App = "ScalableNginxExample"
    }
  }
  spec {
    replicas = 2
    selector {
      match_labels = {
        App = "ScalableNginxExample"
      }
    }
    template {
      metadata {
        labels = {
          App = "ScalableNginxExample"
        }
      }
      spec {
        container {
          image = "nginx:1.7.8"
          name = "example"
          port {
            container_port = 80
          }
          resources {
            limits = {
              cpu    = "0.5"
              memory = "512Mi"
            }
            requests = {
              cpu    = "250m"
              memory = "128Mi"
            }
          }
        }
      }
    }
  }
}

resource "kubernetes_service" "nginx" {
  metadata {
    name = "nginx-example"
  }
  spec {
    selector = {
      App = kubernetes_deployment.nginx.spec.0.template.0.metadata[0].labels.App
    }
    port {
      node_port = 30201
      port      = 80
      target_port = 80
    }
    type = "NodePort"
  }
}

```

- `terraform apply`
- `http://localhost:30201/`

```
GMN21:learn-terraform-deploy-nginx-kubernetes grand$ kubectl get all --all-namespaces

GMN21:learn-terraform-deploy-nginx-kubernetes grand$
```

Scale the deployment replica = 4

```
terraform apply
```

```
GMN21:learn-terraform-deploy-nginx-kubernetes grand$ terraform apply
kubernetes_deployment.nginx: Refreshing state... [id=default/scalable-nginx-example]
kubernetes_service.nginx: Refreshing state... [id=default/nginx-example]
```

An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
~ update in-place

Terraform will perform the following actions:

```
# kubernetes_deployment.nginx will be updated in-place
~ resource "kubernetes_deployment" "nginx" {
  id      = "default/scalable-nginx-example"
  # (1 unchanged attribute hidden)

  ~ spec {
    ~ replicas      = "2" -> "4"
    # (4 unchanged attributes hidden)

    # (3 unchanged blocks hidden)
  }
  # (1 unchanged block hidden)
}
```

Plan: 0 to add, 1 to change, 0 to destroy.

Do you want to perform these actions?

Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.

Enter a value:

```
GMN21:learn-terraform-deploy-nginx-kubernetes grand$ kubectl get all --all-namespaces
```
